

# SCS

THE HEART OF THE FIRM

The analysis of a Company internal processes often highlights the need to manage information pertinent to different categories of persons or personal names, as Employees, Temporary Employees, Consultants, Visitors, Partners.

These processes related to the Company and the Persons, as they usually concern different departments, often are not managed effectively.

We can surely identify one of the reasons in the lack of effective communication means between the different Departments; this causes asynchronisms between the Company Departments, with negative effects on the company productivity and image.

The solution designed by Digitronica.IT is SCS, Security Core System, the heart of the firm.

**SCS is the only company repository where a business can store all the data referring to a personal name that, for any reason, had had any relevance for the company.**

**It is an open platform, available in entirely web based form, that manages information and defines in detail the processes of “recovering” and the interaction processes between the different users of the system.**

**Security Core System manages the relationship Company – Personal Name for the following processes:**

- Collecting, sharing and distributing information pertinent to personal names and necessary for the different Company branches for the management of their processes
- The unambiguous identification of a personal name in the Company environment.
- Security intended as control of policies of physical access to areas and information access.

**SCS insures a powerful proliferation of the account that allows to define:**

- the visibility of information: SCS states who can visualise or modify information and the data entry procedures.
- visibility of functions: SCS communicates the authorisation to inserting, updating and deleting data

# SCS

THE HEART OF THE FIRM

## TECHNICAL SPECIFICATIONS:

- Available entirely in web based form
- Also ready to work on scalable high availability architectures: CLUSTER and Network Load Balancing.
- Application authentication integrated to Active Directory.
- Can interface with different access control systems, human resources management systems, temporary job management systems.
- Integrated with all Digitronica IT software: Multi Access, ACS, PhotoBase, PhotoGuest, CarsAccess

MOBILE BARCODE LINK GENERATOR

## When to use SCS:

- Company repository: SCS collects and distributes the information relevant to a personal name, necessary for an authorisation process and shared by all the systems integrated with it.
- Logic and Physical Security Integration: SCS allows to manage the access to information or to areas with a single interface.
- Centralisation of different kinds of access control software: SCS is the central system that allows the integrated use of access control software by different producers, standardizing their management.

## Why choose SCS:

- Rationalise and quickens the internal authorisation processes;
- Allows a centralised management of access control;
- Reduces the error margin in inserting and maintaining data;
- Grants more security by disabling with a single operation the authorisation to a personal name information or accesses.
- Insures the alignment of the different authorisations on the grounds of what defined in each originating system, to eliminate possible mistakes or omissions
